Hund's rule of maximum multiplicity is a rule based on observation of atomic spectra, which is used to predict the ground state of an atom or molecule with one or more open electronic shells. The rule states that for a given electron configuration, the lowest energy term is the one with the greatest value of spin multiplicity. This implies that if two or more orbitals of equal energy are ...

Adsorption is a physical process, in which a gaseous substance (or liquid) forms a thin layer on the surface of a solid. A typical example of adsorption is the adsorption of gases on activated carbon. Substances on the surface of atoms and molecules are not all from the same side of the atoms or molecules, and for this reason there are valence- or other types of forces ...

In atomic physics, Hund's rules refer to a set of simple rules used to determine which is the spectroscopic ground state of an atom. They were proposed by Friedrich Hund. In chemistry, the first of these rules is particularly important, and is often referred to simply as the 'Hund rule'.

Thermal processing is a common method for food production. Due to high temperature techniques, flavoring and coloring substances are formed which are desirable effects for some food products: roasting of coffee, cocoa and cereals, baking of cakes and bread as well as grilling of meat increases the 'quality' of these foods. The underlying mechanism for their formation is the so-called ...

A number of in vivo studies (with animals and humans) have suggested that phage therapy may be beneficial in the treatment of difficult to treat antibiotic resistant pulmonary infections (e.g. cystic fibrosis and pneumonia), topical and wound infections, and gastrointestinal infections. 3.1.
